Model 44-92 Xenon Gas Proportional Detector

1. GENERAL

The Model 44-92 is a large area xenon-filled proportional type detector that is typically used for Beta/Gamma surveying and personnel contamination checks.

The Model 44-92 xenon gas is contained in a sealed chamber. The tube is similar to a GM tube since it does not have to be recharged.

The Model 44-92 has a 140 cm² open area

that provides faster surveying and contamination checks with a relatively high sensitivity for the lower gamma energies, such as from ¹²⁵I (40 keV).

The electronic counting instrument has to be capable of supplying up to 2000 volts with a input sensitivity of approximately 1.5 mV. Many of the Ludlum instruments are capable of providing these specifications.
